

ME 6590 Multibody Dynamics Matrices and Second Order Dyadics

Dyads and Dyadics

- A *dyad* is a **vector-vector product** that has the following properties

$$\begin{aligned}
 (\underline{a}\underline{b}) \cdot \underline{c} &= (\underline{b} \cdot \underline{c})\underline{a} && \text{(a vector parallel to } \underline{a} \text{)} \\
 \underline{c} \cdot (\underline{a}\underline{b}) &= (\underline{c} \cdot \underline{a})\underline{b} && \text{(a vector parallel to } \underline{b} \text{)} \\
 (\underline{a}\underline{b} + \underline{c}\underline{d}) \cdot \underline{e} &= (\underline{b} \cdot \underline{e})\underline{a} + (\underline{d} \cdot \underline{e})\underline{c} && \text{(a vector with components along } \underline{a} \text{ and } \underline{c} \text{)} \\
 \underline{e} \cdot (\underline{a}\underline{b} + \underline{c}\underline{d}) &= (\underline{e} \cdot \underline{a})\underline{b} + (\underline{e} \cdot \underline{c})\underline{d} && \text{(a vector with components along } \underline{b} \text{ and } \underline{d} \text{)}
 \end{aligned}$$

- *Dyadics* are **linear combinations** of dyads. A common example is the *inertia dyadic*.
- The *inertia dyadic* of a body about a set of **body-fixed** axes passing through its **mass-center** G may be written as

$$\boxed{I_{\underline{G}} = \sum_{i=1}^3 \sum_{j=1}^3 I'_{ij} \underline{e}_i \underline{e}_j} \quad (1)$$

- Here, each of the **unit vector** products $\underline{e}_i \underline{e}_j$ ($i, j = 1, 2, 3$) are called **dyads**.
- The **inertia values** I'_{ij} form the elements of the **inertia matrix** and are called the **components** of the **dyadic** in the body-fixed reference frame $B: (\underline{e}_1, \underline{e}_2, \underline{e}_3)$.
- Like vectors, dyadics can be represented by **different components** in **different reference frames**. Consider the dyadic $\underline{\underline{A}}$ and its representations in two different reference frames $R: (\underline{n}_1, \underline{n}_2, \underline{n}_3)$ and $S: (\underline{e}_1, \underline{e}_2, \underline{e}_3)$

$$\boxed{\underline{\underline{A}} = \sum_{k,\ell} a_{k\ell}^R \underline{n}_k \underline{n}_\ell = \sum_{i,j} a_{ij}^S \underline{e}_i \underline{e}_j} \quad (2)$$

- Here, $a_{k\ell}^R$ ($k, \ell = 1, 2, 3$) represent the **components** of $\underline{\underline{A}}$ in $R: (\underline{n}_1, \underline{n}_2, \underline{n}_3)$, and a_{ij}^S ($i, j = 1, 2, 3$) represent the **components** in $S: (\underline{e}_1, \underline{e}_2, \underline{e}_3)$.

Relationship between Dyadic Components in Different Frames

- This section formulates a *relationship between any two sets of components* of a dyadic. In the development of that relationship, it is assumed that the matrix $[R]^T$ transforms vectors and their components from frame $S:(\underline{e}_1, \underline{e}_2, \underline{e}_3)$ into frame $R:(\underline{n}_1, \underline{n}_2, \underline{n}_3)$.
- The components of \underline{A} in *two different reference frames may be related* by noting

$$\begin{aligned} \sum_{i,j} a_{ij}^S \underline{e}_i \underline{e}_j &= \sum_{i,j} a_{ij}^S \left(\sum_k R_{ik} \underline{n}_k \right) \left(\sum_\ell R_{j\ell} \underline{n}_\ell \right) \\ &= \sum_{k,\ell} \left(\sum_{i,j} (a_{ij}^S R_{ik} R_{j\ell}) \right) \underline{n}_k \underline{n}_\ell \\ &= \sum_{k,\ell} a_{k\ell}^R \underline{n}_k \underline{n}_\ell \end{aligned}$$

- *Comparing the last two equations*, we note that

$$\boxed{a_{k\ell}^R = \sum_{i,j} a_{ij}^S R_{ik} R_{j\ell} = \sum_{i,j} R_{ki}^T a_{ij}^S R_{j\ell}}$$

Or, in matrix form

$$\boxed{[A_R] = [R]^T [A_S] [R]} \quad (3)$$

- This result can be *applied* to the *inertia matrix* of rigid bodies. Given $[I'_G]$ the inertia matrix of a body about a set of *body-fixed axes* passing through the *mass-center G*, we can calculate the inertia matrix $[I''_G]$ about any other set of axes passing through G by using Eq. (3).

$$\boxed{[I''_G] = [R]^T [I'_G] [R]}$$

- Here $[R]^T$ represents the transformation matrix that converts vector components in the “*prime*” system to vector components in the “*double prime*” system.
